

## MINOR PROJECT #1 REPORT

## MY DATA, MY STORY

*Personal Activity Intelligence Report*

| Student Details           | Info                                |
|---------------------------|-------------------------------------|
| Student Name              | Samarpreet Singh                    |
| Registration / Roll No.   | 12601472 / 30                       |
| Program / Section         | MCA / D1P2633                       |
| Activity Recording Period | 13 August 2026 to 20 September 2026 |
| Date of Report Generation | 27-09-2026                          |

## 1. Activity Data Summary

| Particular                          | Value          |
|-------------------------------------|----------------|
| Expected number of days             | 39             |
| Valid days recorded                 | 39             |
| Missing days                        | 0              |
| Invalid / excluded records          | 0              |
| Average Sleep/day                   | 364.36 min/day |
| Average Fitness/day                 | 32.18 min/day  |
| Average Study/day                   | 69.00 min/day  |
| Average Coding/day                  | 55.26 min/day  |
| Average Class/day                   | 256.28 min/day |
| Average Other Activities/day        | 121.92 min/day |
| Average Free / Unaccounted Time/day | 541.00 min/day |

## 2. Index Values

Enter the final value generated by your Python program. The activity indicators are based on simple averages across valid recorded days. PAI is calculated using the predefined weights shown below.

| Index Name              | Acronym     | Formula                                                                                        | Value to Enter |
|-------------------------|-------------|------------------------------------------------------------------------------------------------|----------------|
| Personal Activity Index | <b>PAI</b>  | <b>PAI</b> = 0.15(TPI) + 0.20(AAI) + 0.15(PhAI) + 0.20(SRI) + 0.15(TUI) + 0.10(EI) + 0.05(DCI) | 291.18         |
| Tech Productivity       | <b>TPI</b>  | <b>TPI</b> = Average(Coding Time per valid recorded day)                                       | 55.26min/day   |
| Academic Activity       | <b>AAI</b>  | <b>AAI</b> = Average(Study Time + Class Time per valid recorded day)                           | 325.28 min/day |
| Physical Activity       | <b>PhAI</b> | <b>PhAI</b> = Average(Fitness Time per valid recorded day)                                     | 32.18 min/day  |
| Sleep & Recovery        | <b>SRI</b>  | <b>SRI</b> = Average(Sleep Time per valid recorded day)                                        | 364.36 min/day |
| Activity Balance        | <b>ABI</b>  | <b>ABI</b> = Average(Free / Unaccounted Time per valid recorded day)                           | 541.00 min/day |
| Time Utilization        | <b>TUI</b>  | <b>TUI</b> = Average(Total Tracked Time per valid recorded day)                                | 899.00 min/day |
| Experience Index        | <b>EI</b>   | <b>EI</b> = Average of daily (Feeling Score + Satisfaction Score + Energy Score) / 3           | 2.86 / 5       |
| Data Continuity Index   | <b>DCI</b>  | <b>DCI</b> = (Valid Recorded Days / Expected Days) × 100                                       | 100.00 %       |

Formula references: All time values are taken directly from the activity record and averaged across valid recorded days. Feeling, Satisfaction and Energy are scored using the prescribed 5/4/3/2/1, 5/4/3/2/1 and 3/2/1 scales respectively. PAI uses the predefined weights shown above. DCI rewards complete and continuous recording from 13 August 2026.

## 3. Key Findings from My Data

| No. | Correlation/Observation | Evidence from my data                                                                           |
|-----|-------------------------|-------------------------------------------------------------------------------------------------|
| 1   | Sleep ↔ Energy          | r = -0.26 (weak negative relationship). Sleep duration alone could not predict my energy level. |

|   |                      |                                                                                                                           |
|---|----------------------|---------------------------------------------------------------------------------------------------------------------------|
| 2 | Study ↔ Satisfaction | $r = -0.18$ (little or no clear relationship).<br>Study time did not have a strong direct relationship with satisfaction. |
| 3 | Coding ↔ Energy      | $r = 0.05$ (little or no clear relationship).<br>Coding time and Energy level has almost negligible relationship.         |

#### 4. Findings About Myself (100–200 words)

Write about what your activity data revealed about your habits, priorities, consistency, balance, academic/technical engagement, and the relationship between activities and your reported experience.

During this 39-day record period, I was able to maintain complete consistency as I recorded all 39 days from 13 August to 20 September 2026 with no invalid entries. My routine was mainly focused on academics: As my academic activity index was 325.28 minutes per day including 256.28 minutes of classes and 69 minutes of self-study. I also spent 55.26 minutes per day on coding, showing regular technical engagement alongside my coursework. My average for fitness time was 32.18 minutes while my average for sleep was 364.36 minutes. High track 899 minutes per day in total and still had around 541 minutes of my free time. As for my experience index of 2.86 out of 5, it shows that my overall daily experience was moderate rather than consistently high. As for the correlations between sleep and energy, study and satisfaction, and coding and energy are all weak. Therefore, it can be seen that my reported experience appears to be influenced by balance, workload and other personal factors, and not by one activity alone.

#### 5. Areas and Ways to Improve My Lifestyle (100–200 words)

Identify the areas you would like to improve and describe specific, realistic ways in which you intend to improve them based on the evidence from your data.

I want to improve my routine of sleep, physical activity and my focused work. As it can be seen at my average sleep was about 6 hours and 4 minutes per day so I want to aim for a more regular bedtime and wake up time, then gradually move towards at least seven hours of sleep. The weak sleep energy correlation shows that I should improve my sleep quality by avoiding staying up late at night. My fitness average was 32.18 minutes but I want to make this more consistent by scheduling at least 30 minutes or workout session on at least five days every week. Since I already spend 325.28 minutes per day on academics, I'll divide study tasks into shorter planned sessions and will take small breaks to avoid overload and confusion. I also want to improve my coding practice from 55.26 minutes to focused one hour on most of the days. Then finally I want to use part of my 541 minutes of free time for rest, hobbies and planning so that my routine remains balanced.

## 6. Student Declaration

I confirm that the values entered in this report have been generated from my submitted activity data using my Python program and that the report represents my own analysis.

| Student Name     | Signature                                                                         | Date       |
|------------------|-----------------------------------------------------------------------------------|------------|
